

Name (Last, First):

Solutions

This exam consists of 5 questions on 7 pages. Be sure you have the entire exam before starting. The point value of each question is indicated at its beginning; the entire exam is worth 100 points. Individual parts of a multi-part question are generally assigned approximately the same point value; exceptions are noted. For this exam you are allowed to bring a single page of notes (front and back). You may NOT share material with another student during the exam. Use of electronic devices is not allowed.

Be concise and clearly indicate your answers. Presentation and simplicity of your answers may affect your grade. Answer each question in the space following the question. If you find it necessary to continue an answer elsewhere, clearly indicate the location of its continuation and label its continuation with the question number and subpart if appropriate.

You should read through all the questions first, then pace yourself.

Short answer questions

(a) Consider the following C code snippet:

```
int *q = (int *) 0x3CDE2210;
q = q + 2;
```

What is the value of p after executing this snippet? Give the value in hexadecimal.

When doing pointer arithmetic the C compiler multiplies integer values and expressions by the size of the value pointed to. In this case an int, which is 4 bytes. So, we have $0x3CDE2210 + (2 \times 4) = 0x3CDE2210 + 8 = \boxed{0x3CDE2218}$

(b) Consider the following C code snippet:

```
uint32_t r = ((0x11223344) >> 16) & 0xFFFF;
```

What is the value of r in hexadecimal after executing this statement?

$0x11223344 \gg 16 = 0x1122$
 $0x1122 \& 0xFFFF = \boxed{0x1122}$

(c) Give the 8-bit binary 2's complement value for the integer -14. Show your work.

Two approaches:

① Direct

	128	64	32	16	8	4	2	1
	0	0	0	0	1	1	1	0

$8 + 4 + 2 = 14$

invert 1 1 1 1 0 0 0 1

add 1

$\boxed{11110010}$

② Remainder and divide

$14 \div 2 = 7$	0
$14 / 2 = 7$	
$7 \div 2 = 3$	1
$7 / 2 = 3$	
$3 \div 2 = 1$	1
$3 / 2 = 1$	
$1 \div 2 = 0$	1
$1 / 2 = 0$	

invert
 1 1 1 1 0 0 0 1

add 1
 + 1

$\boxed{11110010}$

(d) Assume you have a Direct Mapped Cache with 128 words and block size of 8 words. How many total slots does this cache have? How many slot index bits are there in a 64 bit address?

$\frac{128 \text{ words total}}{8 \text{ words per slot}} = \boxed{16 \text{ slots}}$

Since $2^4 = 16$

$\boxed{4 \text{ slot index bits}}$

2 (20 points)

RISC-V Assembly Part 1

Consider the following RISC-V assembly code snippets and initial register values. Show the values of each register used next to each instruction. For example:

```
li t0, 2      # t0 ← 2
sub t0, t0, t0 # t0 ← 2 - 2 = 0
```

You must show your work to get credit.

(a) Assume $t0 = 5$, $t1 = 2$, $t2 = 8$. What is the value of $t0$ after executing this snippet?

```
sub t0, t2, t1 # t0 ← 8 - 2 = 6
mul t0, t0, t2 # t0 ← 6 × 8 = 48
srli t0, t0, 2 # t0 ← 48 >> 2
```

$$48/4 = 12$$

$t0 = 12$

(b) Assume $t0 = 4$, $t1 = 5$. What is the value of $t0$ after executing this snippet?

```
bne t0, t1, bar # t0 != t1 | 4 != 5 | true
addi t0, t0, 11
j end
```

bar:

```
addi t0, t0, 2 # t0 ← 4 + 2 = 6
j foo
```

foo:

```
bne t0, t1, end # t0 != t1 | 6 != 5 | true
addi t0, t0, 44
```

end:

```
addi t0, t0, 2 # t0 ← 6 + 2 = 8
```

$t0 = 8$

(c) Assume $t0 = 15$, $t1 = 30$. What is the value of $t0$ after executing this snippet?

```
addi sp, sp, -8
sw t1, (sp) # mem[sp] = 30
addi t1, t1, -2 # t1 ← 30 - 2 = 28
sw t1, 4(sp) # mem[sp+4] = 28
addi t0, sp, 4 # t0 ← sp + 4
lw t0, (t0) # t0 ← mem[sp+4] = 28
addi sp, sp, 8
```

$t0 = 28$

(d) Assume $t0 = 3$, $t1 = 2$, $t2 = 5$. What is the value of $t0$ after executing this snippet? How many instructions are executed in this snippet? Labels do not count as instructions, but branches count if they are taken or not.

start:

```
blt t2, t1, finish
addi t0, t0, 3
addi t2, t2, -1
j start
```

finish:

```
addi t0, t0, 2
```

```
1 blt t2, t1, finish # 5 < 2 | f
2 addi t0, t0, 3 # t0 ← 3 + 3 = 6
3 addi t2, t2, -1 # t2 ← 5 + (-1) = 4
4 j start
5 blt t2, t1, finish # 4 < 2 | f
6 addi t0, t0, 3 # t0 ← 6 + 3 = 9
7 addi t2, t2, -1 # t2 ← 4 + (-1) = 3
8 j start
9 blt t2, t1, finish # 3 < 2 | f
10 addi t0, t0, 3 # t0 ← 9 + 3 = 12
11 addi t2, t2, -1 # t2 ← 3 + (-1) = 2
12 j start
```

3

```
13 blt t2, t1, finish # 2 < 2 | f
14 addi t0, t0, 3 # t0 ← 12 + 3 = 15
15 addi t2, t2, -1 # t2 ← 2 + (-1) = 1
16 j start
17 blt t2, t1, finish # 1 < 2 | t
18 addi t0, t0, 2 # t0 ← 15 + 2 = 17
```

$t0 = 17$

18 total instructions

3 (20 points)

RISC-V Assembly Part 2

Consider the following RISC-V assembly function. Answer the questions below.

```
.global func_s
.global strlen
func_s:
    addi sp, sp, -32
    sd ra, (sp)
    sd a0, 8(sp)
    sd a1, 16(sp)

    mv a0, a1
    call strlen
    mv t0, a0
    ld a0, 8(sp)
    ld a1, 16(sp)
    li t1, 0
    mv t2, t0
    addi t2, t2, -1
loop:
    bge t1, t0, done
    add t4, a1, t2
    lb t5, (t4)
    add t4, a0, t1
    sb t5, (t4)
    addi t1, t1, 1
    addi t2, t2, -1
    j loop
done:
    li t5, zero
    add t4, a0, t1
    sb t5, (t4)

    ld ra, (sp)
    addi sp, sp, 32
    ret
```

(a) What does this function do? Give a possible C prototype for this function.

Reverses a string. The source string pointed to by a1 is reversed and put into memory pointed to by a0. void reverse(char*dst, char*src)

(b) What caller-saved registers are preserved if any?

ra, a0, a1

(b) What callee-saved registers are preserved if any?

sp

(d) How much stack space is actually used by this function (this is not the same as how much is allocated)?

0(sp) 8 bytes
8(sp) 8 bytes
16(sp) 8 bytes

$8 + 8 + 8 = 24$

24 bytes used
out of 32

4 (20 points)

Recursive Linked List Counting

Consider the following version of `countll_c`, called `countll_rec_c` that counts the number of nodes in a linked list recursively.

```
struct node_st {
    int value;
    struct node_st *next_p;
};

int countll_rec_c(struct node_st *np) {
    int count;

    if (np == NULL) {
        count = 0;
    } else {
        count = 1 + countll_rec_c(np->next_p);
    }

    return count;
}
```

Write an equivalent RISC-V Assembly version of this program called `countll_rec_s`. Your implementation must be recursive, must follow the logic in the C version, and must follow the RISC-V calling conventions. You can write your program in two columns to make it fit on this page if necessary.

```
.global countll_rec_s

# a0 - struct node_st *np
countll_rec_s:
    addi sp, sp, -16
    sd ra, (sp)
    bne a0, zero, countll_rec_step
    li a0, 0
    j countll_rec_done
countll_rec_step:
    ld a0, 8(a0)
    call countll_rec_s
    addi a0, a0, 1
countll_rec_done:
    ld ra, (sp)
    addi sp, sp, 16
    ret
```

RISC-V Machine Code Encoding

For this problem we are going to build instruction encoders. That is, we are going to write functions that construct 32-bit instruction words from individual field values. Think of this as the opposite of the decoding we did in Project04. First, consider the R-type instruction format:

```

|31          25|24      20|19      15|14      12|11          7|6      0|
|      funct7      |  rs2   |   rs1   |  funct3   |      rd      | opcode |

```

Here is an encoder function for the R-type:

```

uint32_t encode_r_type(uint32_t funct7, uint32_t rs2, uint32_t rs1,
                      uint32_t funct3, uint32_t rd, uint32_t opcode) {

    return (funct7 << 25) | (rs2 << 20) | (rs1 << 15) | (funct3 << 12) | (rd << 7) | opcode;
}

```

Now, consider the B-type instruction word format:

```

|31          25|24      20|19      15|14      12|11          7|6      0|
| imm[12]imm[10:5] |  rs2   |   rs1   |  funct3   | imm[4:1]imm[11] | opcode |

```

Implement the encoder function for the B-type format. You can only use C variables and operators, you cannot assume you have helper functions like `get_bits()`. Hint: you will need to take apart the `imm` value to get the different parts to put in the final instruction word.

```

uint32_t encode_b_type(int32_t imm, uint32_t rs2, uint32_t rs1,
                      uint32_t funct3, uint32_t opcode) {

```

```

    uint32_t rv;
    uint32_t imm12 = (imm > 12) & 0b1;
    uint32_t imm11 = (imm > 11) & 0b1;
    uint32_t imm10_5 = (imm > 5) & 0b11111;
    uint32_t imm4_1 = (imm > 1) & 0b1111;

```

```

    rv = (imm12 << 31) | (imm10_5 << 25) | (rs2 << 20)
        | (rs1 << 15) | (funct3 << 12) | (imm4_1 << 8)
        | (imm11 << 7) | opcode;

```

```

    return rv;

```

```

}

```
